

## Describing network traffic

- Traffic patterns
- Application requirements
- QoS parameters and descriptions

## Mixed traffic in the network [1]

- Different applications:
  - traffic (generation) profiles
  - traffic timing constraints
- Routers use FCFS queues:
  - no knowledge of application
  - no knowledge of traffic patterns
- Different traffic types share same network path
- Consider three different applications ...

## Mixed traffic in the network [2]

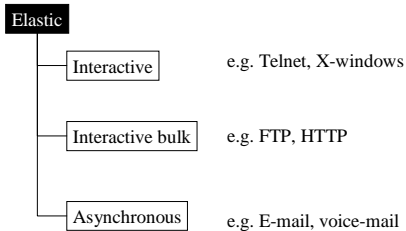

- Router:
  - 3 input lines: serviced FCFS at a router
  - 1 output line (1 output buffer)

## Mixed traffic in the network [3]

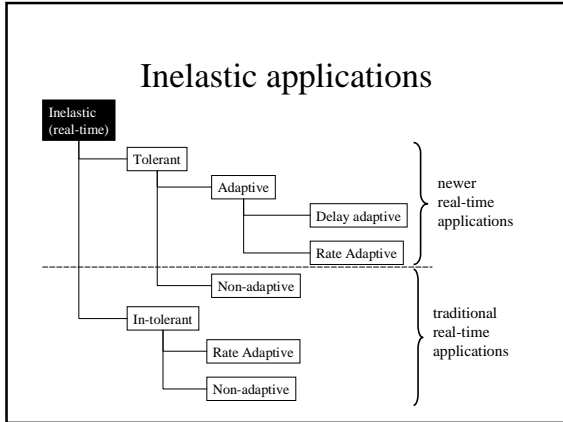

- Different traffic patterns:
  - different applications
  - many uses of an application
  - different requirements
- Traffic aggregation:
  - core: higher aggregation
  - many different sources
  - hard to model
- Routing/forwarding:
  - destination-based
  - single metric for all traffic
  - queuing effects
- Large packet size:
  - good for general data
  - “router friendly”
  - “slows” real-time traffic
- Small packet size:
  - good for real-time data
  - less end-to-end delay
  - better tolerance to loss
  - (less jitter?)
  - less efficient (overhead)
  - “not router-friendly”

## Elastic applications

## Examples of elastic applications

- E-mail:
  - asynchronous
  - message is not real-time
  - delivery in several minutes is acceptable
- File transfer:
  - interactive service
  - require “quick” transfer
  - “slow” transfer acceptable
- Network file service:
  - interactive service
  - similar to file transfer
  - fast response required
  - (usually over LAN)
- WWW:
  - interactive
  - file access mechanism(!)
  - fast response required
  - QoS sensitive content on WWW pages

- ### Examples of inelastic applications
- Streaming voice:
    - not interactive
    - end-to-end delay not important
    - end-to-end jitter not important
    - data rate and loss very important
  - Real-time voice:
    - person-to-person
    - interactive
  - Important to control:
    - end-to-end delay
    - end-to-end jitter
    - end-to-end loss
    - end-to-end data rate

- ### QoS parameters for the Internet [1]
- | Delay   | Jitter   |
|---|--|
| <ul style="list-style-type: none"> <li>• Not possible to request maximum delay value</li> <li>• No control over end-to-end network path</li> <li>• Possible to find actual values for:               <ul style="list-style-type: none"> <li>– maximum end-to-end delay, <math>D_{MAX}</math></li> <li>– minimum end-to-end delay, <math>D_{MIN}</math></li> </ul> </li> </ul> | <ul style="list-style-type: none"> <li>• Not possible to request end-to-end jitter value</li> <li>• Approximate maximum jitter:               <ul style="list-style-type: none"> <li>– <math>D_{MAX} - D_{MIN}</math></li> <li>– evaluate <math>D_{MIN}</math> dynamically</li> <li>– <math>D_{MAX}</math>? 99th percentile?</li> </ul> </li> <li>• Jitter value:               <ul style="list-style-type: none"> <li>– transport-level info</li> <li>– application-level info</li> </ul> </li> </ul> |

- ### QoS parameters for the Internet [2]
- | Loss  | Packet size   |
|---|---|
| <ul style="list-style-type: none"> <li>• Not really a QoS parameter for IP networks</li> <li>• How does router honour request?</li> <li>• Linked to data rate:               <ul style="list-style-type: none"> <li>– hard guarantee?</li> <li>– probabilistic?</li> <li>– best effort?</li> </ul> </li> <li>• (Traffic management and congestion control)</li> </ul> | <ul style="list-style-type: none"> <li>• Restriction: path MTU</li> <li>• May be used by routers:               <ul style="list-style-type: none"> <li>– buffer allocation</li> <li>– delay evaluation</li> </ul> </li> </ul> |

- ### QoS parameters for the Internet [3]
- |   |  |
|---|--|
| <ul style="list-style-type: none"> <li>• Data rate:               <ul style="list-style-type: none"> <li>– how to specify?</li> </ul> </li> <li>• Data applications are bursty:               <math display="block">\frac{\text{peak data rate}}{\text{mean data rate}} \gg 1</math> </li> <li>• Specify mean data rate?               <ul style="list-style-type: none"> <li>– peak traffic?</li> </ul> </li> <li>• Specify peak data rate?               <ul style="list-style-type: none"> <li>– waste resources?</li> </ul> </li> </ul> | <ul style="list-style-type: none"> <li>• Real-time flows:               <ul style="list-style-type: none"> <li>– may be constant bit rate</li> <li>– can be variable bit rate</li> </ul> </li> <li>• Application-level flow:               <ul style="list-style-type: none"> <li>– application data unit (ADU)</li> </ul> </li> <li>• Data rate specification:               <ul style="list-style-type: none"> <li>– application-friendly</li> <li>– technology neutral</li> </ul> </li> </ul> |
|---|--|

- ### Delay
- | End-to-end delay   | Delay bounds?   |
|--|---|
| <ul style="list-style-type: none"> <li>• Propagation:               <ul style="list-style-type: none"> <li>– speed-of-light</li> </ul> </li> <li>• Transmission:               <ul style="list-style-type: none"> <li>– data rate</li> </ul> </li> <li>• Network elements:               <ul style="list-style-type: none"> <li>– buffering (queuing)</li> <li>– processing</li> </ul> </li> <li>• End-system processing:               <ul style="list-style-type: none"> <li>– application specific</li> </ul> </li> </ul> | <ul style="list-style-type: none"> <li>• Internet paths:               <ul style="list-style-type: none"> <li>– “unknown” paths</li> <li>– dynamic routing</li> </ul> </li> <li>• Other traffic:               <ul style="list-style-type: none"> <li>– traffic patterns</li> <li>– localised traffic</li> <li>– “time-of-day” effects</li> </ul> </li> <li>• Deterministic delay:               <ul style="list-style-type: none"> <li>– impractical but not impossible</li> </ul> </li> </ul> |

## Jitter (delay jitter)

- End-to-end jitter**
  - Variation in delay:
    - per-packet delay changes
  - Effects at receiver:
    - variable packet arrival rate
    - variable data rate for flow
  - Non-real-time:
    - no problem
  - Real-time:
    - need jitter compensation
- Causes of jitter**
  - Media access (LAN)
  - FIFO queuing:
    - no notion of a flow
    - (non-FIFO queuing)
  - Traffic aggregation:
    - different applications
  - Load on routers:
    - busy routers
    - localised load/congestion
  - Routing:
    - dynamic path changes

## Loss

- End-to-end loss**
  - Non-real-time:
    - re-transmission, e.g.: TCP
  - Real-time:
    - forward error correction and redundant encoding
    - media specific “fill-in” at receiver
  - Adaptive applications:
    - adjust flow construction
- Causes of loss**
  - Packet-drop at routers:
    - congestion
  - Traffic violations:
    - mis-behaving sources
    - source synchronisation
  - Excessive load due to:
    - failure in another part of the network
    - abnormal traffic patterns, e.g. “new download”
  - Packet re-ordering may be seen as loss

## Data rate

- End-to-end data rate**
  - Short-term changes:
    - during the life-time of a flow, seconds
  - Long-term changes:
    - during the course of a day, hours
  - Protocol behaviour:
    - e.g. TCP congestion control (and flow control)
- Data-rate changes**
  - Network path:
    - different connectivity
  - Routing:
    - dynamic routing
  - Congestion:
    - network load – loss
    - correlation with loss and/or delay?
  - Traffic aggregation:
    - other users
    - (time of day)

## Network probing: a quick note

- Can use probes to detect:
  - delay
  - jitter
  - loss
  - data rate
- Use of network probes:
  - ping
  - traceroute
  - pathchar
- Probes load the network, i.e. the affect the system being measured
- Measurement is tricky!
- See:
  - [www.caida.org](http://www.caida.org)
  - [www.nlanr.net](http://www.nlanr.net)

## Perceived QoS

- Consider application-specific (media-specific) features
- Real-time – VoIP:
  - packet loss rate of 1/20 for voice
  - what if the first or last phoneme is lost?
  - losing the start of a word leads to lower perceived QoS!
  - other factors (jitter, delay)
- Streaming:
  - can cope with loss by buffering at the receiver
  - what about data rate?
- For example – video:
  - low data rate
  - small picture size
  - low refresh (e.g. 3fps)
  - low colour depth
  - **OK** for adverts, news reels
  - **Not OK** for entertainment

## Interactive, real-time media flows

- Audio/video flows:
  - streaming audio/video
  - use buffering at receiver
- Interactive real-time:
  - only limited receiver buffering
  - delay + jitter <150ms
  - (jitter <150ms)
  - keep loss low
- Effects of loss:
  - depend on application, media, and user
- Audio:
  - humans tolerant of “bad” audio for speech
  - humans like “good” audio for entertainment
- Video:
  - humans tolerant of “low” quality video for business
  - humans like “high” quality video for entertainment
- Audio – video sync:
  - separate flows?

## Audio

- **QoS requirements**
  - Delay < 150ms:
    - including jitter
  - Low loss preferable:
    - loss tolerant encodings exist
  - Data rates:
    - speech  $\leq 64\text{Kb/s}$
    - “good” music  $\geq 128\text{Kb/s}$
- Time domain sampling
  - Example – packet voice:
    - 64Kb/s PCM encoding
    - 8-bit samples
    - 8000 samples per second
    - 40ms time slices of audio
    - 320 bytes audio per packet
    - 48 bytes overhead (20 bytes IP header) (8 bytes UDP header) (20 bytes RTP header)
    - 73.6Kb/s

## Video

- **QoS requirements**
  - Delay < 150ms:
    - including jitter
    - same as audio
    - inter-flow sync
  - Loss must be low
  - Data rate – depends on:
    - frame size
    - colour depth
    - frame rate
    - encoding
- Frequency domain:
  - discrete cosine transform (DCT)

## Summary

- Different applications have different needs
- Some QoS requirements are application-specific and media-specific:
  - perceived QoS
- Different requirements for real-time multimedia and streamed multimedia
